

NIST Cybersecurity Framework — Overview

NIST Cybersecurity Framework Overview

The Framework provides a common language for managing cybersecurity risk. It consists of five core functions: Identify, Protect, Detect, Respond, and Recover. Together these functions provide a high-level strategic view of the lifecycle of an organization's management of cybersecurity risk.

IDENTIFY: Develop organizational understanding to manage cybersecurity risk to systems, assets, data, and capabilities. The activities in this function are foundational for effective use of the Framework. Examples: Asset Management, Business Environment, Governance, Risk Assessment.

PROTECT: Develop and implement appropriate safeguards to ensure delivery of critical services. The Protect function supports the ability to limit or contain the impact of a potential cybersecurity event. Examples: Identity Management, Awareness and Training, Data Security, Information Protection Processes.

DETECT: Develop and implement appropriate activities to identify the occurrence of a cybersecurity event. Examples: Anomalies and Events, Security Continuous Monitoring, Detection Processes.

RESPOND: Develop and implement appropriate activities regarding a detected cybersecurity event. Examples: Response Planning, Communications, Analysis, Mitigation, Improvements.

RECOVER: Develop and implement appropriate activities to maintain plans for resilience and to restore any capabilities or services that were impaired due to a cybersecurity event. Examples: Recovery Planning, Improvements, Communications.
